

AD/HD

About Sound Therapy:

Sound-based therapy involves the use of sound vibration that impacts the body using special equipment, programs, modified music, and/or specific tones/beats, the need for which is identified with appropriate testing.

About AD/HD:

AD/HD is a constellation of context-dependent behaviors that are most prevalent in very constrictive environments. The terms AD and ADHD were recently combined into AD/HD because it includes both the inattention component and the hyperactivity-impulsive component. The four primary symptoms are: 1) Temporal processing deficits, 2) Disinhibition (impulsivity and reward aversion), 3) Working memory deficits, and 4) Hyperactivity.

Therapies Offered:

AIT, Tomatis®, Fast ForWord™, Interactive Metronome™, BioAcoustics™, and home programs. Therapies are only suggested after completing the Diagnostic Evaluation for Therapy Protocol (DETP®) which determines if any sound-based therapy is appropriate and when it is, in the correct order. We utilize *The Davis Model of Sound Intervention*®.

Sound-based therapies are not medical treatments. They do not cure or treat medical disease conditions. They work on supporting change in learning, development, and wellness. The work of The Davis Center is no substitute for a medical diagnosis and treatment.
