

Apraxia

Apraxia and Sound-Based Therapy

Sound-based therapy supports positive change with:

- Stimulating oral motor movement, tongue, lips, jaw, and palate
- Developing understandable simple vocabulary
- Improved use of consonant production
- Developing combined Phoneme usage
- Developing longer sentence lengths
- Improved expressive language skills

About Sound Therapy:

Sound-based therapy involves the use of sound vibration that impacts the body using special equipment, programs, modified music, and/or specific tones/beats, the need for which is identified with appropriate testing.

About Apraxia:

Apraxia of speech is a motor-speech programming disorder resulting in difficulty expressing and/or coordinating the oral-motor movements necessary to produce and combine speech sound (phonemes) to form syllables, words, phrases and sentences on voluntary (rather than reflexive) control. Many children are able to hear words, and are able to understand what they mean, but they can't change what they hear into the words.

Therapies Offered:

AIT, Tomatis®, Fast ForWord™, Interactive Metronome™, BioAcoustics™, and home programs. Therapies are only suggested after completing the Diagnostic Evaluation for Therapy Protocol (DETP®) which determines if any sound-based therapy is appropriate and when it is, in the correct order. We utilize *The Davis Model of Sound Intervention*®.

Sound-based therapies are not medical treatments. They do not cure or treat medical disease conditions. They work on supporting change in learning, development, and wellness. The work of The Davis Center is no substitute for a medical diagnosis and treatment.
