

Asperger's Syndrome

About Sound Therapy:

Sound-based therapy involves the use of sound vibration that impacts the body using special equipment, programs, modified music, and/or specific tones/beats, the need for which is identified with appropriate testing.

About Asperger's syndrome:

Asperger's syndrome falls with the Autism Spectrum, which is a developmental disorder encompassing global sensory issues. Autism is on a spectrum that encompasses a wide continuum of behavior. It is characterized by three distinctive behaviors: 1) difficulties with social interaction, 2) displaying problems with verbal and nonverbal communication, and 3) exhibiting repetitive behaviors or narrow, obsessive interests. These behaviors can range in impact from mild to disabling.

Therapies Offered:

AIT, Tomatis®, Fast ForWord™, Interactive Metronome™, BioAcoustics™, and home programs. Therapies are only suggested after completing the Diagnostic Evaluation for Therapy Protocol (DETP®) which determines if any sound-based therapy is appropriate and when it is, in the correct order. We utilize *The Davis Model of Sound Intervention®*.

Sound-based therapies are not medical treatments. They do not cure or treat medical disease conditions. They work on supporting change in learning, development, and wellness. The work of The Davis Center is no substitute for a medical diagnosis and treatment.
