

Dyslexia

Dyslexia and Sound-Based Therapy

Sound-based therapy supports positive change with:

-
- Decoding
- Phonemic awareness
- Word attack
- Reading comprehension
- Rate and fluency
- Finding the details
- Desire to read
- Ease of reading
- Foundational language skills
- Sound processing

About Sound Therapy:

Sound-based therapy involves the use of sound vibration that impacts the body using special equipment, programs, modified music, and/or specific tones/beats, the need for which is identified with appropriate testing.

About Dyslexia:

Dyslexia is a specific learning disability that is neurological in origin. It is characterized by difficulties with accurate and / or fluent word recognition and by poor spelling and decoding abilities. These difficulties typically result from a deficit in the phonological component of language that is often unexpected in relation to other cognitive abilities and the provision of effective classroom instruction. Secondary consequences may include problems in reading comprehension and reduced reading experience that can impede growth of vocabulary and background knowledge. www.interdys.org

Therapies Offered:

AIT, Listening Training Programs, Tomatis®, Fast ForWord™, Interactive Metronome™, BioAcoustics™, and other home programs. Therapies are only suggested after completing the Diagnostic Evaluation for Therapy Protocol (DETP®) which determines if any sound-based therapy is appropriate and when it is, in the correct order. We utilize *The Davis Model of Sound Intervention*®.

Sound-based therapies are not medical treatments. They do not cure or treat medical disease conditions. They work on supporting change in auditory processing, learning, development, and wellness. The work of The Davis Center is no substitute for a medical diagnosis and treatment.
