

Pregnant Mothers

About Sound Therapy:

Sound-based therapy involves the use of sound vibration that impacts the body using special equipment, programs, modified music, and/or specific tones/beats, the need for which is identified with appropriate testing.

During Pregnancy:

During a baby's development in utero, his/her response to sound is being stimulated. During the seventh month of pregnancy, the ear's neurological system is advancing in its maturity. It is helpful to both baby and mother to enhance this response by bringing the bond between mother and child closer, as well as supporting good sound response processing for future learning and development of the child.

Therapies Offered:

We offer a special Listening Training Program created just for pregnant mothers during their seventh month, based on the work of Dr. Alfred Tomatis.

Sound-based therapies are not medical treatments. They do not cure or treat medical disease conditions. They work on supporting change in learning, development, and wellness.
