

Tourette Syndrome

About Sound Therapy:

Sound-based therapy involves the use of sound vibration that impacts the body using special equipment, programs, modified music, and/or specific tones/beats, the need for which is identified with appropriate testing.

About Tourette syndrome:

Tourette syndrome is an inherited, neurological disorder characterized by repeated involuntary movements and uncontrollable vocal sounds. The symptoms generally appear before the 18th birthday.

Therapies Offered:

AIT, Tomatis®, BioAcoustics™, and home programs. Therapies are only suggested after completing the Diagnostic Evaluation for Therapy Protocol (DETP®) which determines if any sound-based therapy is appropriate and when it is, in the correct order. We utilize *The Davis Model of Sound Intervention®*.

Sound-based therapies are not medical treatments. They do not cure or treat medical disease conditions. They work on supporting change in learning, development, and wellness. The work of The Davis Center is no substitute for a medical diagnosis and treatment.

Tourette syndrome and Sound-Based Therapy

Sound-based therapy supports positive change with:

- Facial tics
- Motor tics
- Uncontrollable vocal sounds
- Repetition of Actions
- Head banging
- Word repetition
- Determination of body imbalances related to: Metal toxicities, biochemical issues, nutritional weaknesses, and muscle tone
